

Simplify tasks for your front line to bring savings to your bottom line

JumpStock™ offers a sophisticated, yet simple, inventory management solution for hospitals, clinics, trauma centers, rehabilitation centers, pharmacies, and other medical providers.

Features

Although simple to use, JumpStock contains many of the features of high-cost, highly-complex inventory management systems, including:

- **Automated ordering with min/max order levels**
- **Easy-click interdepartmental inventory transfers**
- **Support for physician preference items**
- **Lot number and expiration date tracking for easy product recall and waste reduction**
- **Requisition support for non-inventoried items**
- **Enhanced browsing and global search capabilities**
- **Customized labeling using any file format**
- **Easy barcode or UPC application to existing inventory items**
- **Powerful reporting and analysis capabilities**
- **Open system that integrates with most hospital information systems**

Healthcare providers will benefit from an e-procurement barcode solution that automates the inventory management process to:

- Significantly reduce the time medical staff devotes to supply chain functions and more toward patient care
- Use one software platform to manage multiple GPOs and vendors
- Improve purchasing compliance and lower procurement costs
- Optimize inventory levels and avoid stock-outs
- Track perishable medical supplies to reduce waste
- Reduce IT burden by using a cloud-based solution

Doing More with Less

In an era of reform, healthcare organizations are doing more with less in order to improve patient care, reduce costs, and optimize staff performance. JumpStock can cut as much as 60% of the time your staff spends interacting with medical supplies. Medical staff can pull inventory supplies and record it with a simple click of the scanner. If inventory falls below minimum levels, a pro forma order is created for your approval automatically keeping optimal inventory levels consistent and virtually eliminating clerical errors.

JumpStock Features

Rapid Implementation and Minimal Staff Training

Not only is our software easy to use, our implementation process typically takes less than a week. JumpStock is hosted on reliable, secure servers in the cloud, meaning there is no software for your IT staff to install and maintain. Our JumpStock team provides IT administration services including installation, customer support, software upgrades, configuration option selection, legacy data uploads, and staff training so healthcare facilities can concentrate on realizing the benefits of the software.

The **par-level inventory** option is ideal for higher-priced and highly-controlled medical supply items. Under this option, the item being withdrawn from inventory is scanned immediately thereby reducing the inventory balance. Once the item quantity falls below its minimum order point, JumpStock automatically creates a new order.

The **Kanban inventory option** is more suited to low-cost, high-consumption medical supplies. There's no benefit for healthcare facilities to record every pair of surgical gloves or other consumables into and out of inventory. The 2-bin Kanban system is more efficient than par-level for hospital consumables as it reduces the need to track inventory items at the individual level. The barcode is scanned when the first bin is empty to withdraw the entire bin from inventory and automatically create an order to replenish the item saving considerable staff time.

Go Mobile

JumpStock is fully functional on mobile devices. For healthcare employees on-the-go, you can create orders, take inventory, receive shipments, and more all from any iOS or Android-based smart device from any area of the hospital. For example, a nurse who is using a drug interaction application on an iPad can record inventory use from that same device.

Benefits

With JumpStock you can:

- Cut staff time spent on supply management
- Ensure compliance with GPO purchasing contracts
- Create optimal inventory levels and eliminate stock outs
- Eliminate waste from expired items and identify recalls through date and lot tracking

The Results

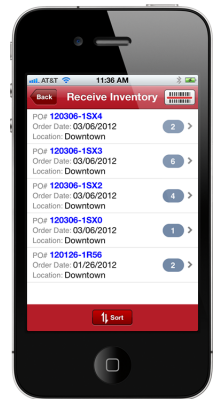

Studies show when you implement procurement and supply automation you reduce:

- Off-contract spending by up to 64%
- Supply costs by up to 7.3% for spending brought back on-contract
- Requisition-to-order cycles by up to 66%
- Requisition-to-order costs by up to 58%
- Total costs by up to up to 20%

JumpStock's easy scanning allows you to scan barcodes of items as you use them. The system automatically creates orders when inventory drops to preset levels. JumpStock supports using the mobile device's built-in camera, external Bluetooth scanners and attached dedicated scanners (iOS only).

Once the order arrives, you use the receiving feature of JumpStock to record the receipt of the product, update your inventory and close the purchase order. This automated receiving process reduces the RTOC again, cutting costs associated with producing a purchase order.

System Requirements

iOS Device Requirements

A supported iPhone, iPod Touch or iPad with:

- iOS 4.3 or above
- JumpStock subscription
- 3 MB free device memory to install

Additional space to download inventory data

Android Device Requirements

A supported Android phone or tablet with:

- Android 2.2 or above
- JumpStock subscription
- 8 MB free device memory to install

Additional space to download inventory data

JumpStock allows you to manually create orders as well as pull, receive, take and add back inventory. Inventory data is stored locally on the mobile device making the application usable with no Internet connection. Once a connection is detected it uploads all the user's actions to the cloud and automatically downloads any changes from other users' inventory adjustments.
